Middle east respiratory syndrome co-v: A journey from panic of the unknown to starting control

Abdulrahman Mahmoud

Ein Shams University School of Medicine, Egypt

From September 2012 up to 31 January 2015, so in only five months, encountered Total of 945 Laboratory-confirmed cases of MERS-CoV with Mortality of 40.7%, 85.8% of the total cases are reported from KSA. Necessity initiates outbreaks investigation, all elements were investigated, but only three elements were in a conflict, case definition, source of infection and mode of transmission. so, this meta-analysis aims at trying to answer the previous three questions, collecting most solid data about the this emerging new infectious disease, establishing a powerful connection between camels and MERS CO- V, putting a question that needs a good answer, which is, IS really modes of transmission of respiratory born illnesses are strict or continuously change, and if changing, what are the factors that they depend on for that change. The other part of the literature will summarize the efforts made to control MERS-CoV, from triaging in the hospitals to developing a rapid response team. so, in conclusion, MERS-CoV still evolving and new cases still coming every winter season in spite of the good plan put to compact which really needs a strict implementation.
