**REGISTERED NURSE AND NURSE PRACTITIONER MEETING**  
&  
**NURSING EDUCATION AND MANAGEMENT**

December 05-06, 2018 | Chicago, USA

---

**Perceptions of nursing care to promote self-management in chronic kidney disease**

**Rahel Bahru**

McGill University, Canada

**Introduction:** Hemodialysis patients often deal with complex lifestyle changes such as diet and fluid restrictions that may alter their physical and emotional well-being. Nurses play an important role in promoting self-management and assisting patients to cope with these changes.

**Purpose:** To explore hemodialysis patients' perspectives of nursing care that enables or hinders their ability to manage their illness.

**Methods:** A qualitative descriptive design was used. Six male and three female hemodialysis patients were interviewed during their outpatient dialysis treatment at a university-affiliated hospital.

**Result:** Three major themes emerged: (1) What it means to live with chronic kidney disease (2) Managing the illness and treatment regimen, and (3) Nature of the therapeutic relationship with nurses to promote self-management. Patients' narratives also revealed six important features of the nurse-patient relationship.

**Conclusion:** Patients identified the nurse's friendly demeanor and being patient-centered as care that assisted them to self-manage. These findings underscore the importance of creating a nurturing and supportive environment and focusing on patients' individual needs. Reflective practice may be a helpful strategy to assist the nurse to consider the interpersonal aspect of the nurse-patient relationship. The nurse's use of motivational interviewing may help to gain the patients' perspective and engage them in their care.
