

The first experiment of woman aroused transiting of morphine smell can detecting approach sex

Rahul Hajare

Post Doc Fellow Indian Council of Medical Research

Abstract: A female mind reacts much more and is more stimulated than a male one when aroused. Turns out, a woman's mind is much more complex than a male's when it comes to intimacy. According to a recent Pune University study, a female mind reacts much more and is more stimulated than a male one when transition of morphine to functional morphine. In the study conducted on 20 men and 20 women, each of the individuals was shown erotic film clips while their brain vitals were scanned by two scanners. One of the scanners was an MRI machine that tracked stimulation in their brains. The other was a heat-seeking camera that measured levels of arousal through participant's genitals. While not massive, the recorded difference between stimulation levels between male and female brains highlighted the consistent disparity between the two counterparts. There were no brain regions in men with stronger brain-genital correlations than in women", the study stated, according to the Independent. While interesting, the sample size for the study was too small, according to researcher Pune University.

was examined in terms of its ability to decrease the lung bacillary load in Balb/c mice infected intravenously with *Mycobacterium tuberculosis*.
