A double-blind, placebo-controlled randomized trial of a homeopathic combination medication for dengue fever was carried out in external health conventions in Honduras. Sixty patients who met the case definition of dengue (fever plus two ancillary symptoms) were randomized to receive the homeopathic drug or placebo for 1 week, along with standard conventional analgesic treatment for dengue. The results showed no difference in issues between the two groups, including the number of days of fever and pain as well as analgesic use and complication rates. Only three subjects had laboratory confirmed dengue. An intriguing sinusoidal curve in reported pain scores was seen in the serum group that might suggest a homeopathic aggravation or a proving. The small sample size makes conclusions delicate, but the results of this study don't suggest that this combination homeopathic remedy is effective for the symptoms that are characteristic of dengue fever.

Dengue fever, also known as break bone fever, is a contagious tropical complaint caused by the dengue contagion. Symptoms include fever, headache [1], muscle and joint pains, and a characteristic skin rash. In a small proportion of cases the complaint develops into the life-threatening dengue haemorrhagic fever, performing in bleeding, low situations of blood platelets and plasma leakage, or into dengue shock syndrome, where dangerously low blood pressure occurs.

Homeopathy has a long record of success in the treatment of pandemics and recent experiences in Brazil and India favour its utility in the management of dengue. The treatment is holistic and individualized and selection of homeopathic drugs depends upon the individual response to infection, inflexibility of complaint and clinical donation of the case [2]. Homeopathy has a potential to reduce the intensity of fever, headache, body ache, weakness, loss of appetite, nausea and other associated symptoms and, also reduce the probability of developing shock, haemorrhage and other complications.

Homeopathic medicine for dengue fever

Homeopathy treats the person as a whole. It means that homeopathic treatment for dengue fever, focuses on the patient as a person [3], as well as his pathological condition. The homeopathic drugs for dengue fever are named after a full individualizing examination and case-analysis, which includes the medical history of the patient, physical and mental constitution etc.

The homeopathy drugs given below indicate the therapeutic affinity but this isn't a complete and definite companion to the homeopathic treatment of dengue fever [4]. The symptoms listed against each homeopathic drug may not be directly related to this disease because in homeopathy general symptoms and constitutional indications are also taken into account for selecting a remedy.

Dengue Fever Homeopathy Treatment

Dengue is a fever which can be very painful for the person who's suffering from it. It's caused on the bite of a mosquito that takes the infection from the other person who's formerly infected with a dengue virus. Homeopathy has the best treatment for dengue and Doctor Bhargava formulations are a result of ways perfected over 100 years

of practice [5]. Some of its major symptoms may include pain behind the eyes, high fever, nausea, severe headaches, vomiting and skin rash. If you're looking for the best Homeopathic Medicine for dengue also Doctor Bhargava natural remedy gives you the best result.

Dengue fever is an infectious fever caused by the bite of a typical mosquito carrying the dengue contagion. Originally, it's the common form of fever and flu, but as time passes, it can cause severe symptoms, which is called dengue haemorrhagic fever, which can be fatal. It can cause an unforeseen drop in blood pressure leading to death. Dengue virus is spread by a carrier mosquito that transports the dengue virus. Dengue virus is most common in tropical and tropical regions of the world. And most of the people infected by the complaint are plant in these regions, including South Asia, Latin America, the key and some areas of Africa. Scientists are floundering to prepare the vaccine against the dengue virus, but homeopathic medicine for dengue fever treats the infection by improving the patient's immunity.

Conclusion

In this quantum-like model of homeopathy clinical trials, success in open-label setting and failure with centralized blind RCTs emerge logically from the formalism. This model suggests that significant differences between placebo and homeopathy in blind RCTs would be plant more frequently if in situ randomization/ unbinding were used.
